

Problem Statements:

Theme 1: Kumbh Mela Innovation

PS 1 — Discover Nashik: Digital Companion for Every Pilgrim

Problem: During Kumbh Mela 2027, millions of pilgrims will visit Nashik and Trimbakeshwar, many for the first time. Information about temples, ghats, accommodation, food, parking, hospitals, attractions and transportation is scattered across multiple platforms, making it difficult to plan and navigate the journey efficiently.

Challenge: A single map-based digital platform that brings essential pilgrimage, tourism and service information together, enabling pilgrims to search, discover, compare, navigate and plan their complete Nashik experience.

PS 2 — AI-Based Crowd Management & Safety

Problem: Large religious gatherings like Kumbh Mela attract millions of visitors, making crowd congestion, overcrowding, missing-person cases, and emergency response difficult to manage.

Challenge: Develop an AI-powered system that monitors crowd density, predicts potential congestion, provides real-time alerts, and helps authorities manage people flow safely.

PS 3 — Smart Pilgrim Assistance & Navigation

Problem: Visitors often struggle to find important locations such as ghats, medical centers, food/water facilities, toilets, accommodation, parking areas, and emergency services.

Challenge: Build a smart multilingual navigation assistant that provides personalized routes, nearby facilities, crowd-aware navigation, and emergency assistance.

Theme 2: AI & Automation

PS 1 — AI-Based Student Dropout Prediction & Counselling

Problem: Educational institutions often identify students at risk of dropping out only after their academic performance has significantly declined.

Challenge: Develop an AI system that analyzes factors such as attendance, academic performance, fees, and other student records to identify high-risk students early and provide explainable insights and appropriate intervention.

PS 2 — AI-Powered Complaint & Grievance Automation

Problem: Organizations receive large numbers of complaints, but manually categorizing, prioritizing, and assigning them can result in delays and unresolved issues.

Challenge: Develop an AI-based system that automatically understands complaints, categorizes them, determines priority, assigns them to the appropriate department, and tracks resolution.

PS 3 — Smart AI Meeting Assistant

Problem: Students and professionals often miss important discussions, decisions, and action points during meetings because manually taking notes is time-consuming and important information can be overlooked.

Challenge: Develop an AI-powered meeting assistant that converts meeting conversations into text, generates concise summaries, automatically identifies action items and responsible tasks, creates reminders, and provides a downloadable meeting report.

Theme 3: Smart Education

PS 1 — Personalized AI Learning Assistant

Problem: Students have different learning speeds, knowledge levels, and learning difficulties, but traditional education generally provides the same learning material to everyone.

Challenge: Develop an AI learning platform that analyzes a student's performance and provides personalized study plans, learning resources, practice questions, and progress tracking.

PS 2 — Early Identification of Learning Difficulties

Problem: Teachers may not be able to identify every student's learning gaps early, especially in large classrooms.

Challenge: Develop a system that analyzes assessment results, assignment performance, attendance, and learning patterns to identify students who need additional support and recommend suitable interventions.

PS 3 — AI-Based Career & Skill Guidance

Problem: Many students struggle to choose appropriate career paths because they lack personalized guidance about their interests, skills, academic performance, and industry requirements.

Challenge: Develop an AI-based career guidance platform that analyzes a student's skills, interests, academic background, and goals to recommend suitable career paths, skills to learn, and personalized development plans.
